9. Which best graph DS(es) should you use to store a simple undirected graph with 200 vertices, [18000..19900] edges, and the neighbours are frequently enumerated?
Suppose your computer only has enough memory to store 40000 entries.

- [x] Adjacency List
- [ ] Adjacency Matrix
- [ ] Edge List

You answered this question wrongly.

The correct answer is: **'Adjacency Matrix', 'Adjacency List'**
Think carefully...

7. Which best graph DS(es) should you use to store a simple undirected graph with 200 vertices, [18000..19900] edges, and the edges need to be sorted?
Suppose your computer only has enough memory to store 40000 entries.

- [ ] Adjacency List
- [x] Edge List
- [ ] Adjacency Matrix

You answered this question correctly! :)

2. Which best graph DS(es) should you use to store a simple undirected graph with 10000 vertices, 10000 edges, and the neighbours are frequently enumerated?
Suppose your computer only has enough memory to store 40000 entries.

- [ ] Edge List
- [ ] Adjacency Matrix
- [x] Adjacency List

You answered this question correctly! :)

5. Which best graph DS(es) should you use to store a simple undirected graph with 200 vertices, [18000..19900] edges, and the existence of **edge(u, v)** is frequently asked?
Suppose your computer only has enough memory to store 40000 entries.

- [ ] Edge List
- [x] Adjacency Matrix
- [ ] Adjacency List

You answered this question correctly! :)

6. DFS and BFS **always** run in **Θ(V^2)** on a:

- [x] Complete Graph
- [ ] Tree
- [ ] Directed Acyclic Graph
- [ ] Bipartite Graph

You answered this question correctly! :)

7. DFS and BFS **can** run in **O(V^2)** on a:

- [ ] Directed Acyclic Graph
- [ ] Tree
- [ ] Bipartite Graph
- [x] Complete Graph

You answered this question wrongly.

The correct answer is: **'Directed Acyclic Graph', 'Bipartite Graph', 'Complete Graph', 'Tree'**
Be careful with the word **always** versus **can**. Note that O(V) is also in O(V^2)...
